

13 What about the Glaslaw Burn?

Properties and roads along the Glaslaw Burn

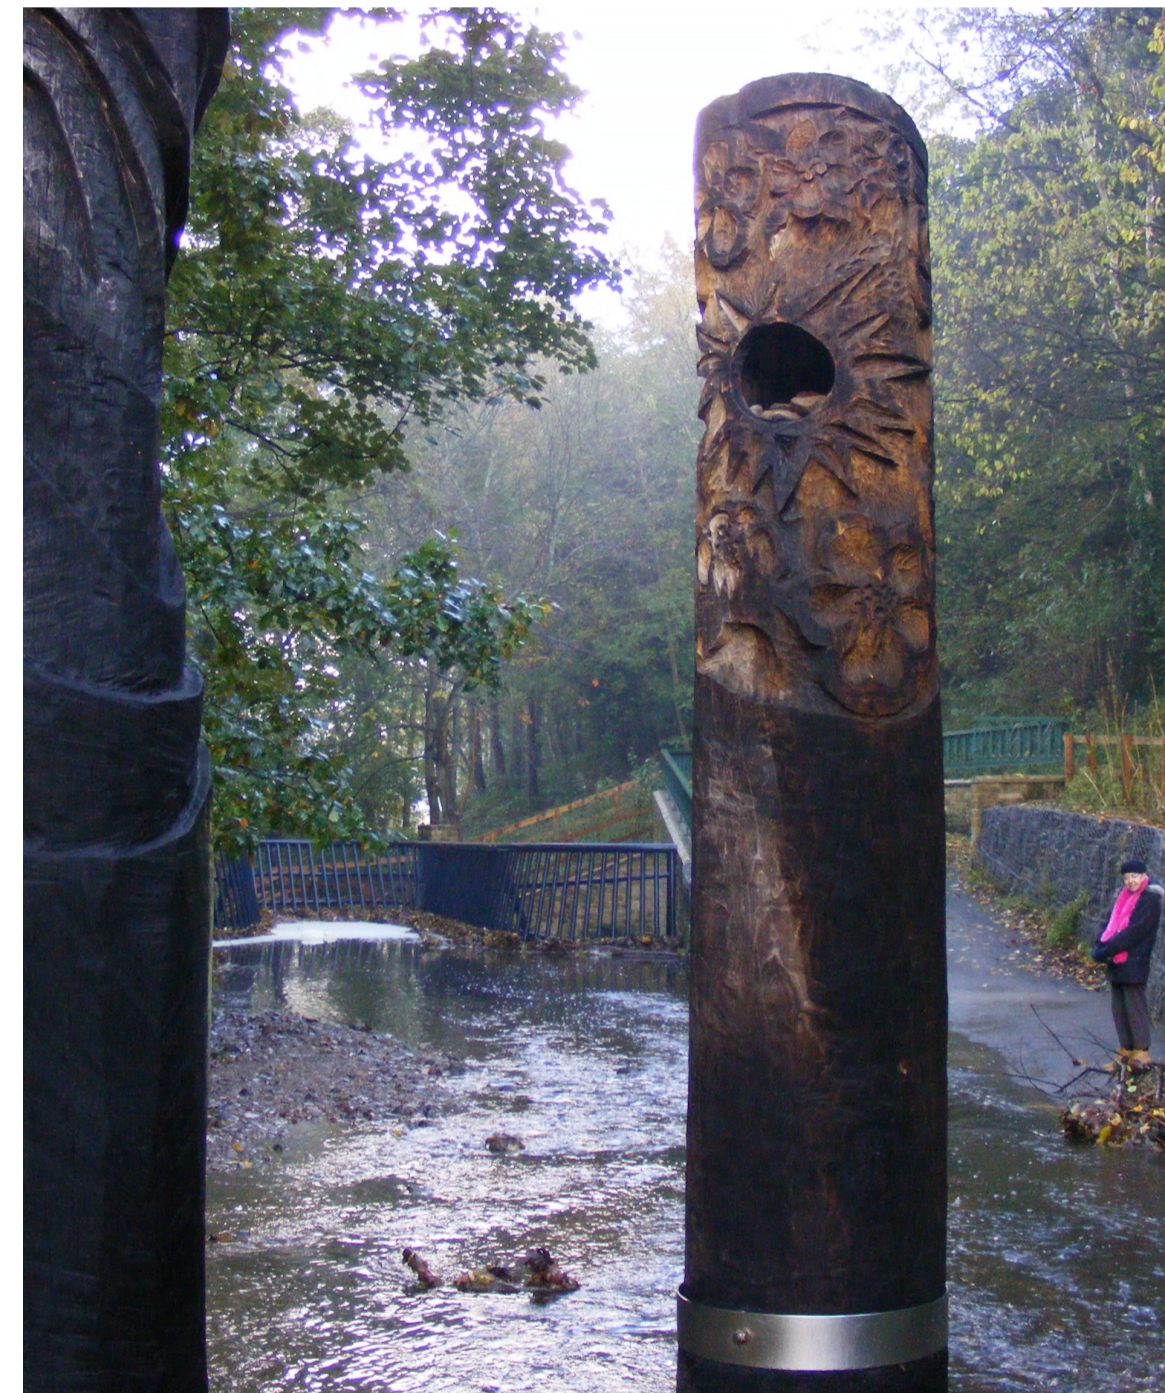

To alleviate the risk of flooding from the Glaslaw Burn, we need to build flood protection measures along the lower reaches of the burn. We need:

- A larger culvert (enclosed bridge) at Woodview Court.
- Low flood walls along Carron Gardens. these will be positioned beside the footpath to allow the burn space to flow and keep a green corridor.
- A flood embankment in the Forestry Commission land behind Carron Gardens.
- A coarse debris screen in the Forestry Commission land behind Carron Gardens.

To match the surroundings, the walls are likely to have a 'harled' finish with stone copings. Some trees will need to be removed; these will be replaced with similar species.

Woodland works

Management may be required within the woodland, subject to discussions with the Forestry Commission. Small-scale shrub removal and coppicing (which is a traditional activity) to reduce the risk of blockages and flooding.

The bollards may be removed at the end of Carron Gardens to allow access.
